ADAPTIVE RED HOOK HOUSING TYPOLOGY

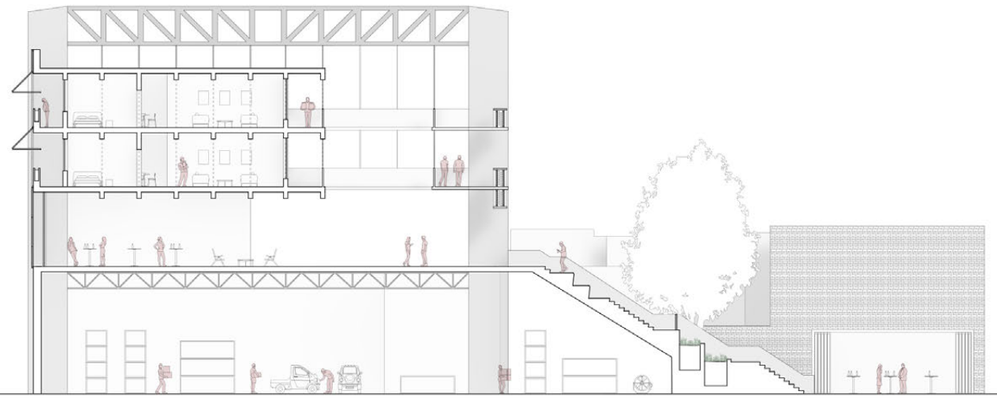

Pratt Institute - Fall 2025
Professors: Deborah Gans, Carolin Mees
Partner: Eshaan Mehta

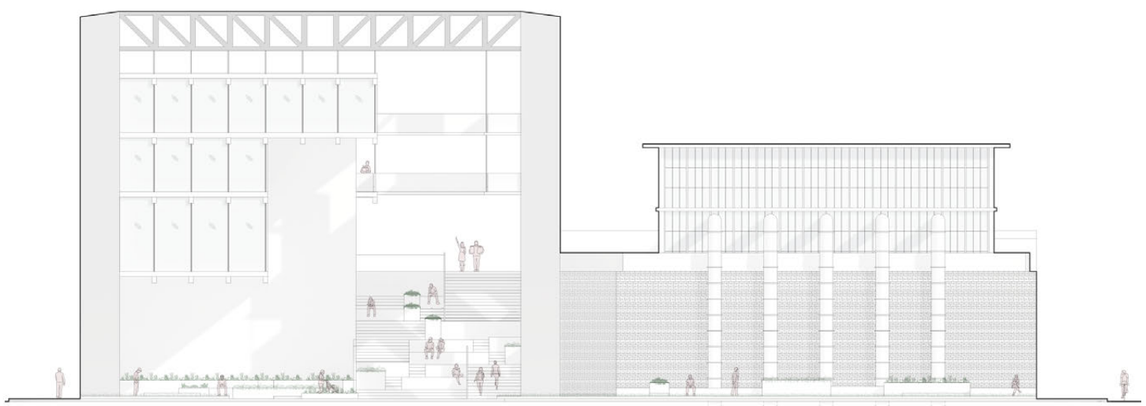

The Adaptive Red Hook Housing Typology proposal is a **site-specific response to the NYC Economic Development Corporation's development proposal** at the Brooklyn Marine Terminal, developed to **enable the environmentally and socially sustainable growth of Red Hook's industrial waterfront.**

Through community engagement, cross-studio collaboration, and on-site analysis, the Adaptive Red Rook Housing Typology fulfills its misson of enabling the environmentally and socially sustainable growth of Red Hook's industrial waterfront by capturing carbon dioxide emissions from three local sources, and feeding them to a closed loop algae bioreactor system, which in turn **produces low-grade heat to be used in residential and commerical applications, while absorbing 102,000 KG of CO2 and producing 5,000 gallons of bioethanol** annually. Additionally, by infusing existing industrial sites with new commercial and residential sequences, the project situates itself as a **social condenser between the industrial and commercial axes** of Red Hook.

CASA SOÑADA

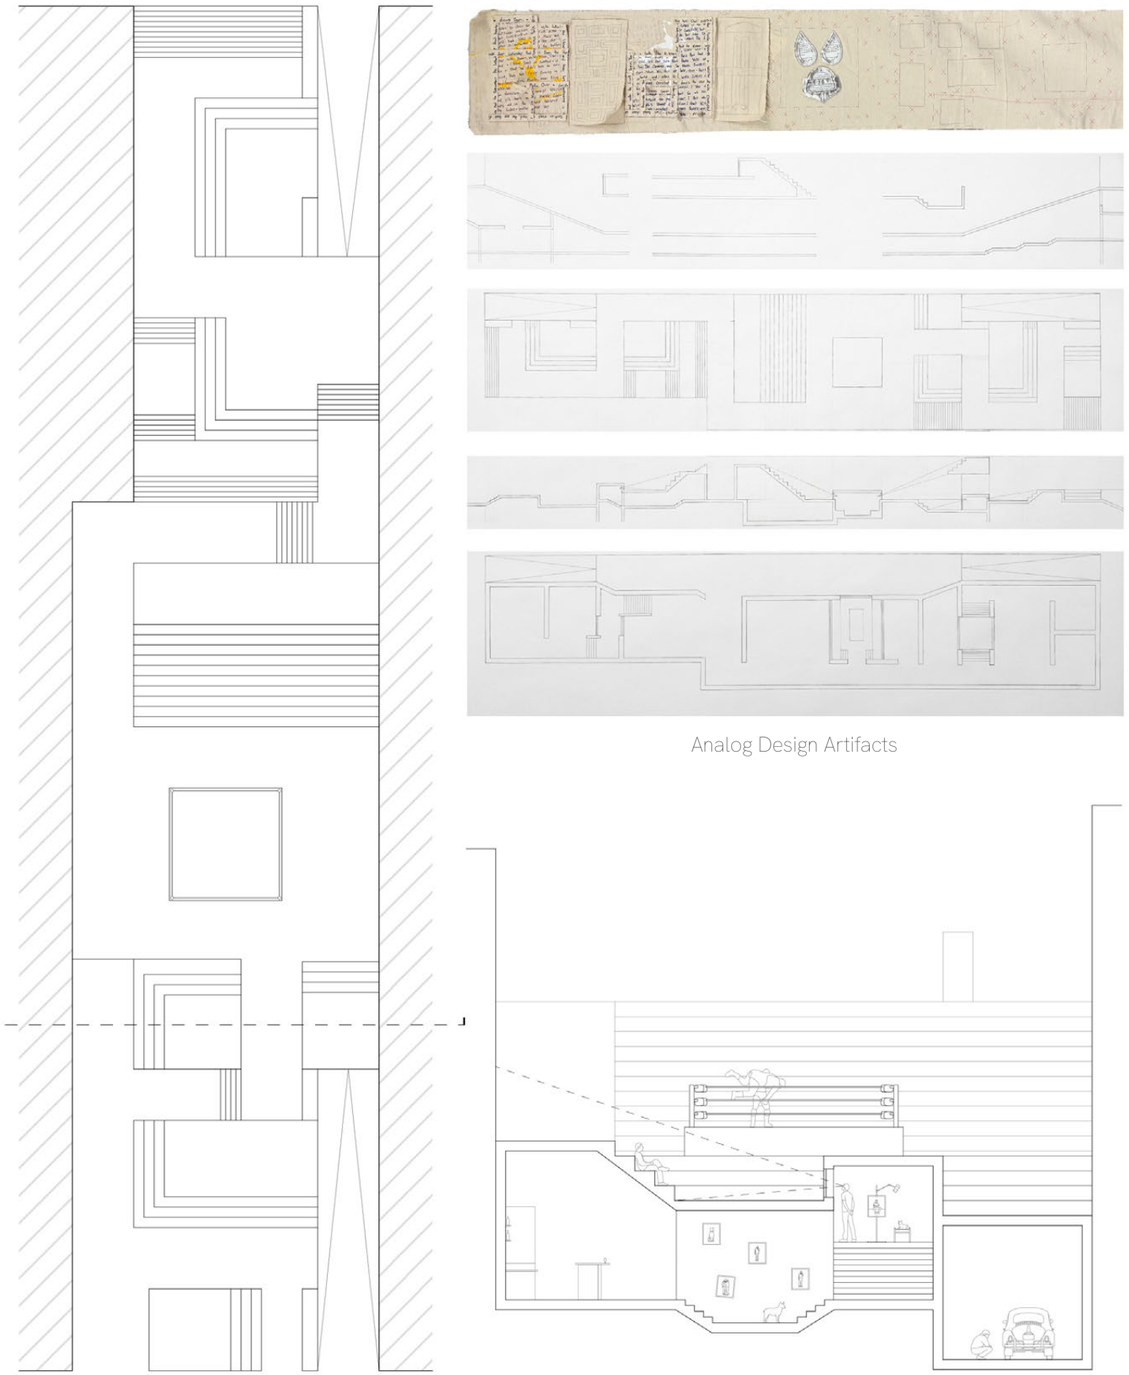

Pratt Institute - Summer 2025
Professors: Chi-Fan Wong, Arie Salomon

Casa Soñada is an architectural project and installation based around street performers in Mexico City. The culmination of a summer study abroad studio, the project was **developed through lived experience sewn into a canvas scroll, a literary narrative drawing from Latin American magical realism, and analog design drawing.**

The project explores the **reversal of roles between performer and audience that takes place in the domestic realm**. Most individuals experience life as part of an audience, whether informally, encountering jugglers or dancers on the street, or at a formal performance such as a concert or lucha libre event, and upon returning home become the performers, sharing fragments of experience with friends and family. **Casa Soñada seeks to codify this inversion** for a street performer living in Mexico City, the protagonist of a developed literary narrative, **by inserting living space into the fabric constituting a public performance commons, with prescribed sight lines out to the audience.** This insertion physically facilitates an inversion in which the viewer becomes the viewed, and the story's protagonist becomes the audience.

Analog Design Artifacts

Before entering the installation, guests gathered outside to read aloud fragments of performance-centric experiences in Mexico City, becoming the performers themselves, unknowingly simulating the project's inversion of roles.

"At a street corner in La Condesa, a man played a battered guitar with fingers worn from years of practice." He caught my eye once and gave a slow nod before returning to his music.

"En Coyoacán, un hombre pintaba caritas de niños cerca de un carrito de churros. Me ofreció pintarme a mí también, diez pesos." Le dije que sí. Nunca me preguntó qué quería. "Jaguar", dijo, "Tienes los ojos adecuados para eso".

"When I set down my beer I saw the man with his bird. He trained it to pick out fortunes in exchange for a treat."

"En la plaza frente a Bellas Artes, un hombre cubierto de pintura dorada se mantenía congelado sobre una caja de madera." No se movía ni un centímetro. Unos niños se reían y lanzaban monedas a un cuenco a sus pies.

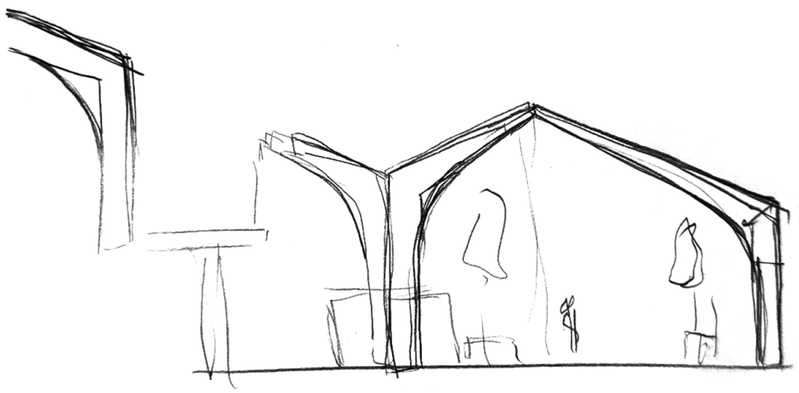

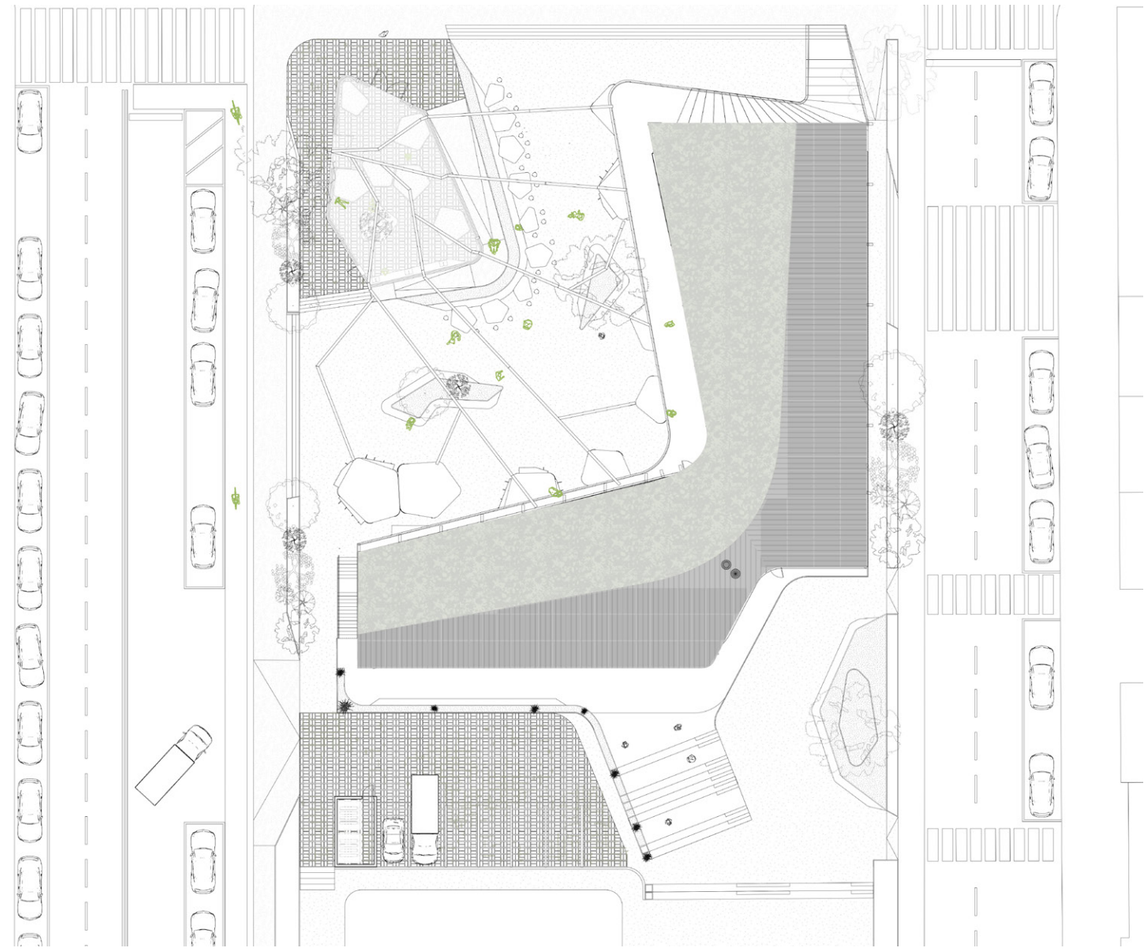

ROOSEVELT URBAN MARKET

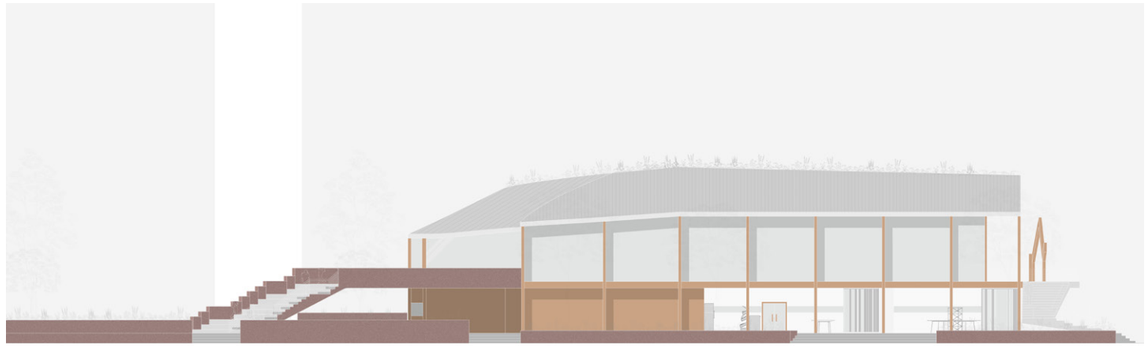

Pratt Institute - Fall 2024
Professor: Gregory Merryweather
Partner: Saddqa Bahidrah

The En-Root Urban Market is a **17,000 square foot community asset** on the Lower East Side of Manhattan that provides local access to a **fresh food market, community classrooms, and event spaces**. The market becomes a **focal point for the neighborhood**- a gathering place for locals and regional fresh food vendors.

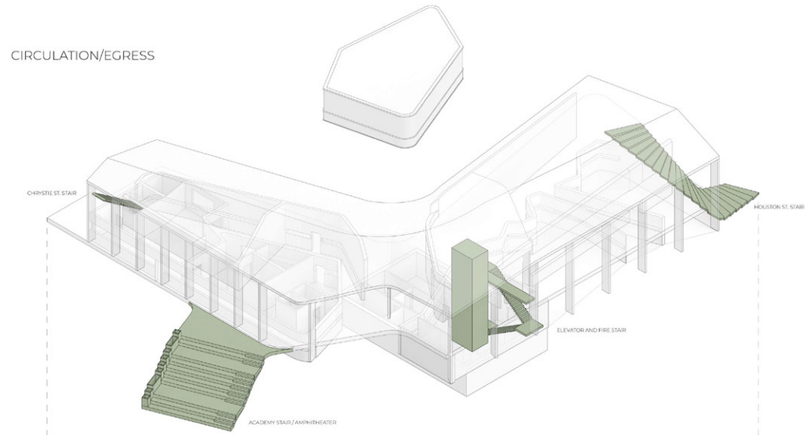

The building form in plan pulls away from the fast-paced corner of Chrystie and E Houston, offering **passage through an array of prepared foods kiosks and fresh ingredient vendors**. This encourages **non-commital engagement** with the market for fast-pace users. Slower-pace users coming from the West are greeted with a more traditional market experience within the Western wing of the ground floor. The **classrooms and event space are elevated on the second floor, allowing public activity to continue below** during private events or classes.

WEBSTER LIBRARY A/V EXPANSION

Pratt Institute - Spring 2024
Professor: Kayleen Kulesza

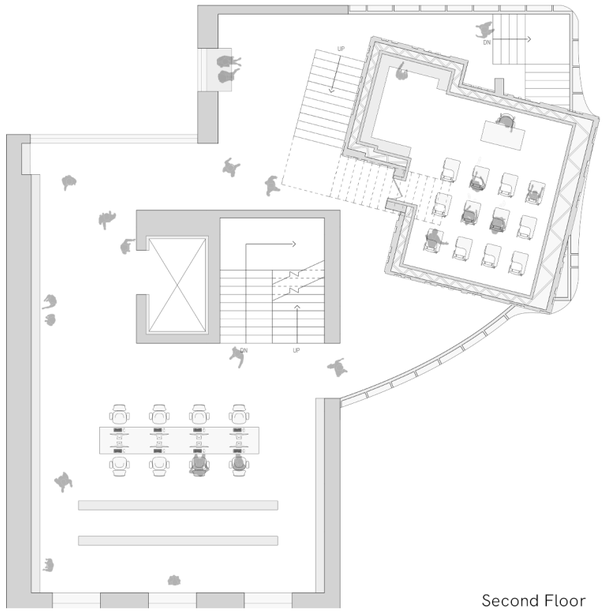

The Webster Library A/V Expansion project adds **11,000 square feet of classrooms, production studios, theaters, and community spaces** to one of New York City's oldest libraries. Located on the Upper East Side of Manhattan, the expansion aims to provide filmmaking resources and facilities accessible to all New Yorkers, **reducing barriers to entry into the city's filmmaking industry.**

The stacked interior volumes reflect a **prioritization of the material and spatial finality of architectural form**, serving as a critique of Le Corbusier's free-plan Domino House model. The building's skin allows light to penetrate the structure while maintaining an **enigmatic boundary between interior and exterior, fostering curiosity and discovery.** This semi-translucent and tensile envelope acts as a unifying membrane, juxtaposing the raw individuality of the stacked forms with a sense of cohesion and transparency.

Study Adaptation of House with One Wall

Christian Kerez's House with One Wall (Left) challenges Le Corbusier's Domino House model by reinterpreting the relationship between structure and space by introducing a single **monolithic wall as both a structural and spatial determinant.**

By extracting and implementing abstract forms from the house, the Webster Library A/V Expansion further prioritizes the **material and spatial finality of architectural form** above universality.
